## Multi-function wireless programmable terminal server - a first from Digi International

13 January 2011

Digi International's new ConnectPort LTS is the industry's first multi-function wireless programmable terminal server. The unit provides serial-to-IP connectivity and optional ZigBee wireless communications, minimising equipment space requirements and reducing cost by combining a terminal server and wireless gateway in one device.

ConnectPort LTS serial servers deliver secure and reliable RS-232/422/485 serial-to-ethernet connectivity and are available in eight, 16 and 32-port options. The wireless version features ZigBee communications, an internal modem and USB 2.0 ports for expandability. All ConnectPort LTS serial servers include dual Gigabit Ethernet, an SD memory slot for data storage and a large LCD screen for easy configuration, monitoring and diagnostics.

The Linux-based ConnectPort LTS is programmable with Python support and a software development kit. Advanced software features include an IPv4/v6 dual stack, user port sharing, port logging, SSHv2 and SSL.
