

Digi: cloud computing platform for wireless M2M

Digi International announces that all Digi and Rabbit embedded products will be configured to easily connect to the iDigi "cloud" out of the box. iDigi is a ready-to-use cloud computing platform for M2M network management. It enables secure remote access, control and management of network-connected devices and complete cloud-based application development. Customers can now easily develop cloud-connected devices that create new revenue streams for device manufacturers and their customers such as ongoing service contracts and value-added services.

iDigi allows manufacturers to configure, upgrade and diagnose problems with their products remotely via the iDigi cloud and provide ongoing performance monitoring. iDigi-ready devices reduce costs for end users because ongoing preventative maintenance via the iDigi cloud results in higher reliability and reduced downtime and repair costs. Additionally, no travel is required for device configuration and maintenance.
