Digi: embedded module integrates cellular, GPS and satellite connectivity

Digi International has introduced the Digi m130, an embedded module that enables products with GSM/GPRS, global positioning system GPS and ORBCOMM satellite connectivity in a single solution. Ideal for fleet management and asset tracking applications, the compact Digi m130 enables remote connectivity to mobile assets via cellular or satellite networks and is the fastest way for device manufacturers to add cellular, GPS and satellite in one design.

Digi m130 customers will also have access to the ready-to-use iDigi cloud computing platform for M2M network management by Q2 2011. The iDigi platform enables secure remote access, control and management of network-connected devices and complete cloud-based application development. A Python development environment for easy application development will also be available by March 2011. Digi will support all current Sierra Wireless Q52 Omni customers. Development kits are available.
