Wireless terminal server

Digi International: The ConnectPort LTS is said to be the industry's first multi-function wireless programmable terminal server, and it is suitable for industrial and building automation, utilities, security, data centre management and many other applications.

This terminal server provides serial-to-IP connectivity and optional ZigBee wireless communications, which makes it easier and more cost-effective to access critical device information. It also minimises equipment space requirements and cost by combining a terminal server and wireless gateway in one device. This device provides secure, reliable and flexible RS- 232/422/485 serial-to-Ethernet connectivity. Eight, 16 and 32-port options are available. Linux-based, it is programmable with Python support and a software development kit. Advanced software features include an IPv4/v6 dual stack, user port sharing, port logging, SSHv2 and SSL.
