Connecting the Wireless Location and Monitoring World

Digi m130

Digi International introduced the Digi m130, an embedded module that allows OEMs to easily add cellular, GPS, and satellite in a single solution. Digi m130's cellular and satellite connectivity provides instant, always-on communications that enable companies to switch networks easily. On-board GPS allows location tracking and geo-fencing. "Featuring both cellular and satellite connectivity allows customers to develop fleet management solutions that can easily switch from one network to another," says Larry Kraft, senior vice president of global sales and marketing, Digi International. "As a vehicle moves out of cell range, it can then use satellite to maintain connectivity. This combined with GPS functionality allows organizations to track their products to within five meters of accuracy virtually anywhere on the planet."
