**32-Bit vs 64-Bit Slots/Boards**

- **5V 32-Bit Slot**

February 2003
PCI-X 1.0

- Based on existing PCI architecture

- 64-Bit slots with support for 3.3V and Universal PCI
  - No support for 5V-only boards!

- Fully backwards-compatible
  - Conventional 33/66 MHz PCI adapters can be used in PCI-X slots
  - PCI-X adapters can be used in conventional PCI slots

- Provides two speed grades: 66 MHz and 133 MHz
  - The slowest board dictates the maximum speed on a particular bus!

- Targeted at high-end data networking and storage network applications
PCI-X 2.0

- Based on PCI-X 1.0
  - Still fully backwards-compatible

- Introduces ECC (Error Correction Codes) mechanism to improve robustness and data integrity

- Provides two additional speed grades
  - PCI-X 266: 266 MHz (2.13 GB/sec)
  - PCI-X 533: 533 MHz (4.26 GB/sec)

- Bandwidth sufficient to support new breed of cutting-edge technologies
  - 10 Gigabit Ethernet / Fiber Channel
  - 4X / 12X InfiniBand
PCI-X Speed Limitations

- PCI-X supports point-to-point and multi-drop loads

- Highest speed grades are supported *exclusively* with point-to-point loads
  - PCI-X 133
  - PCI-X 266
  - PCI-X 533

- Two PCI-X 133 loads operate at 100 MHz

- Four loads operate at a maximum of 66 MHz

- OEMs can build connector-less systems with multiple loads utilizing high speed grades
PCI-X Speed Limitations

Memory Controller

- Maximum speed 133 / 266 / 533 MHz
- Maximum speed 100 MHz
- Maximum speed 66 MHz

The Future of PCI-X

- PCI-X 3.0 specification in development
  - Expected to become available in late 2004

- Backwards-compatible with PCI-X 1.0 / 2.0

- PCI-X 1066 will provide 1066 MHz data rate with 8.5 GB/sec bandwidth

February 2003
PCI Express

- High-speed point-to-point architecture that is essentially a serialized, packetized version of PCI

- General purpose serial I/O bus for chip-to-chip communication, USB 2.0 / IEEE 1349b interconnects, and high-end graphics viable AGP replacement

- Bandwidth 4 Gigabit/second full duplex per lane
  - Up to 32 separate lanes 128 Gigabit/second

- Software-compatible with PCI device driver model

- Expected to coexist with and not displace technologies like PCI-X in the foreseeable future
Buzzworthy

■ InfiniBand
  - Backed by Intel, Sun, Dell, HP and others
  - Connects servers with remote storage and networking devices, and other servers with throughput rates of 2.5 Gigabit/second (1x) to 10 Gigabit/second (4x)
  - Will also be used inside servers for inter-processor communication (IPC) in parallel clusters

■ HyperTransport
  - Promoted by AMD, Cisco, Sun and others
  - Advanced high-speed, high-performance, point-to-point link for integrated circuits
  - System interconnect with peak bandwidth of 12.8GB/sec

■ RapidIO
  - Promoted by IBM, Motorola and others
  - Allows chip-to-chip and board-to-board communications at performance levels scaling to ten Gigabits per second
  - Targeted at embedded world
Q: Does Digi provide PCI-X products?
A: No.

Q: Are Digi products supported in PCI-X systems?
A: Absolutely.*

* All Universal PCI and 3.3V products
Digi and PCI-X

- Extension of the PCI standard providing improved speed, bandwidth, and more efficient bus transaction processing
- PCI-X supports both 3.3V-only and Universal PCI boards
- PCI-X does not support 5V-only PCI boards

- All of Digi’s Universal PCI adapters work in PCI-X systems!

- PCI-X systems allow the use of both PCI and PCI-X cards on the same bus, but the slowest PCI card dictates the bus speed

- PCI-X performance degradation can be easily avoided by separating Digi Universal PCI adapters (33 MHz/32-Bit) and high-performance PCI-X adapters using different PCI-X bus segments!
Avoiding Performance Degradation
